Customer Story

★★★★★ **TR** Score **10 / 10**

"This testing tool meets our every need."

Why Todd Needed BrowserStack:

"BrowserStack is a tremendous tool for us to test our website development projects with a continuously evolving list of devices and browsers. It connects our project pages directly with the actual mobile devices, not just an emulator. We have never been let down by using its tools to confirm that our responsive designs are working properly across all technologies."

How Todd Uses BrowserStack:

"This is the only tool we use for testing new websites or updates. With automation and a wide expanse of devices, OS, and browsers, it's our one-stop solution for making sure our sites will look proper across the board. Within minutes we can test our projects and have confidence that they'll work in the real world."

What Todd Likes Most About BrowserStack:

"The connection to real devices instead of emulators gives us much more confidence in the views we're getting. The GUI is extremely easy to navigate, allowing us to quickly jump from device to device and various browsers within the device."

What Todd Has Achieved with BrowserStack:

"Return on investment:

- It saves us thousands of dollars in not having to buy the devices ourselves.

- It saves us time because we can do all of our testings from a single device, even passing the URLs between devices to save the step of calling up pages.

- We can have a production person run the tests without needing to be skilled at using the individual devices."

Todd's Advice

"BrowserStack was recommended to us six years ago and we've not found any reason to search elsewhere. It does everything that we need a testing tool like this to do…I honestly don't know of any scenarios where you wouldn't want this tool in your box."
